# AI ASSISTED CODING

# LAB-19.1

**Katta Lasya**

**2303A51724**

**Batch-11**

Task:

Translate a simple Python class into Java using AI assistance.

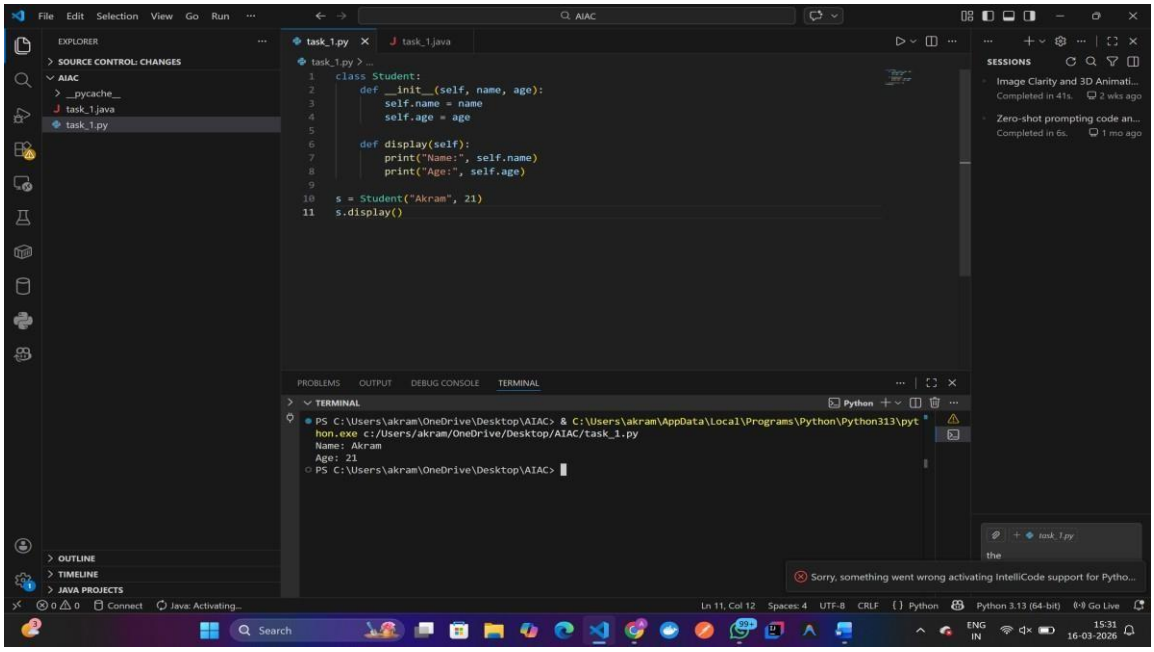
Instructions:

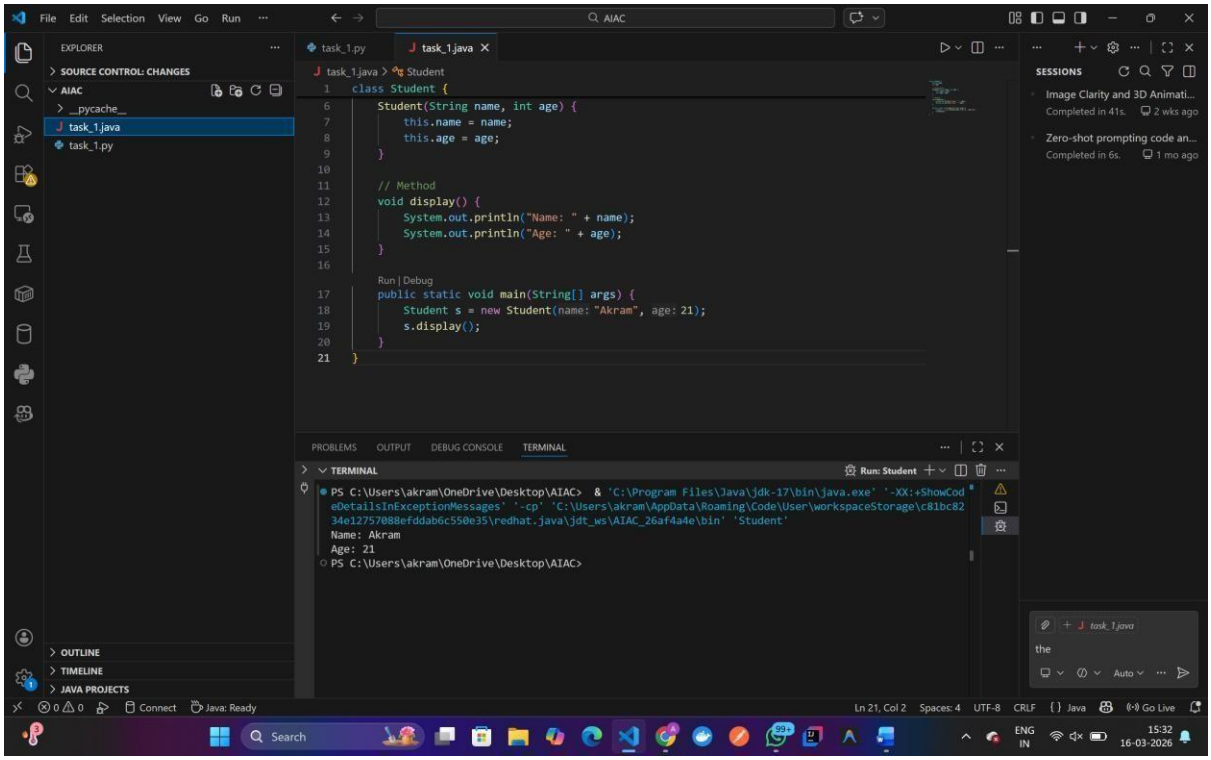
- Prompt AI to convert a Python class with attributes and methods into equivalent Java code.
- Verify that constructors, method signatures, and data types are properly handled.
- Run both versions (Python & Java) to compare expected outputs.

Expected Output:

- Equivalent working Java class translated from Python.

CODE:





**Task 2 – C++ to Python Function Conversion**

Task:

Convert a C++ function for factorial calculation into Python.

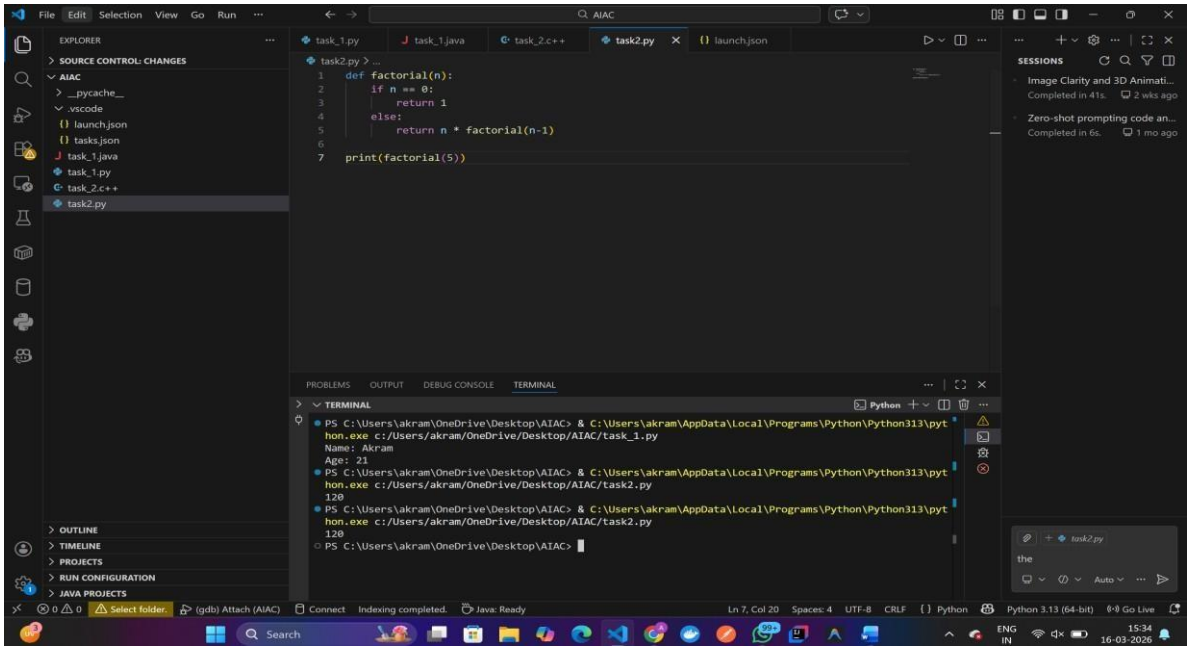
Instructions:

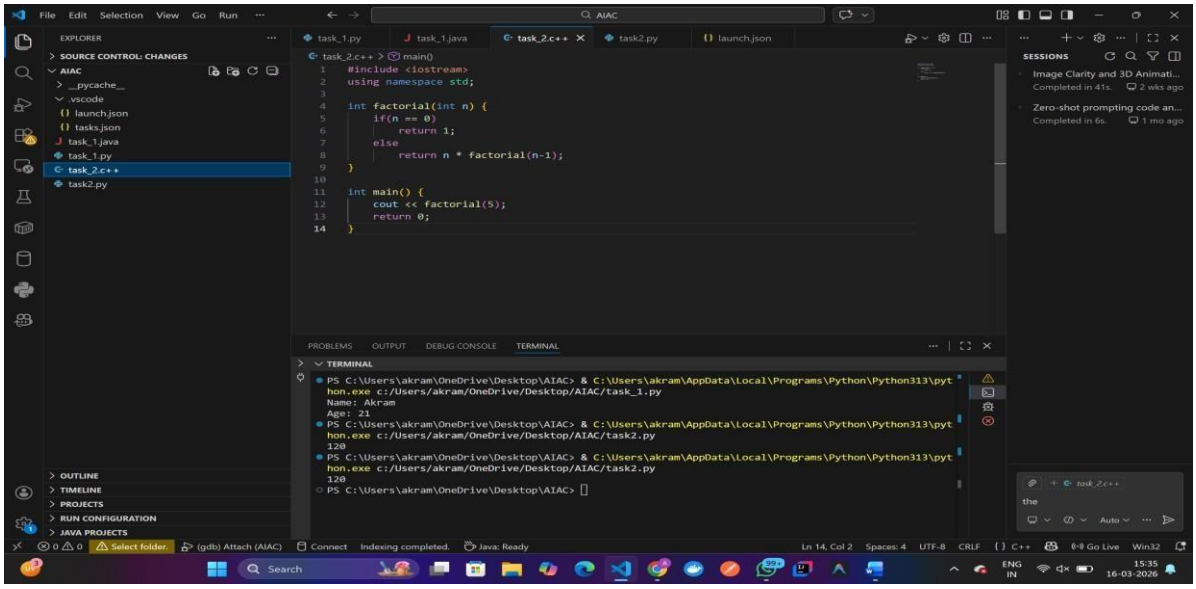
- Ask AI to translate a recursive C++ factorial function into Python.
- Validate correctness by testing with sample inputs.
- Ensure Python version follows Pythonic conventions.

Expected Output:

- A correct Python implementation equivalent to the original C++ factorial function.

**CODE**:





**Task 3 – SQL to Pandas Query**

Task:

Translate a SQL query into a Pandas DataFrame operation in

Python.

Instructions:

- Provide AI with a SQL query (e.g., SELECT name, salary

FROM employees WHERE salary > 50000).

- Ask AI to generate equivalent Pandas code.

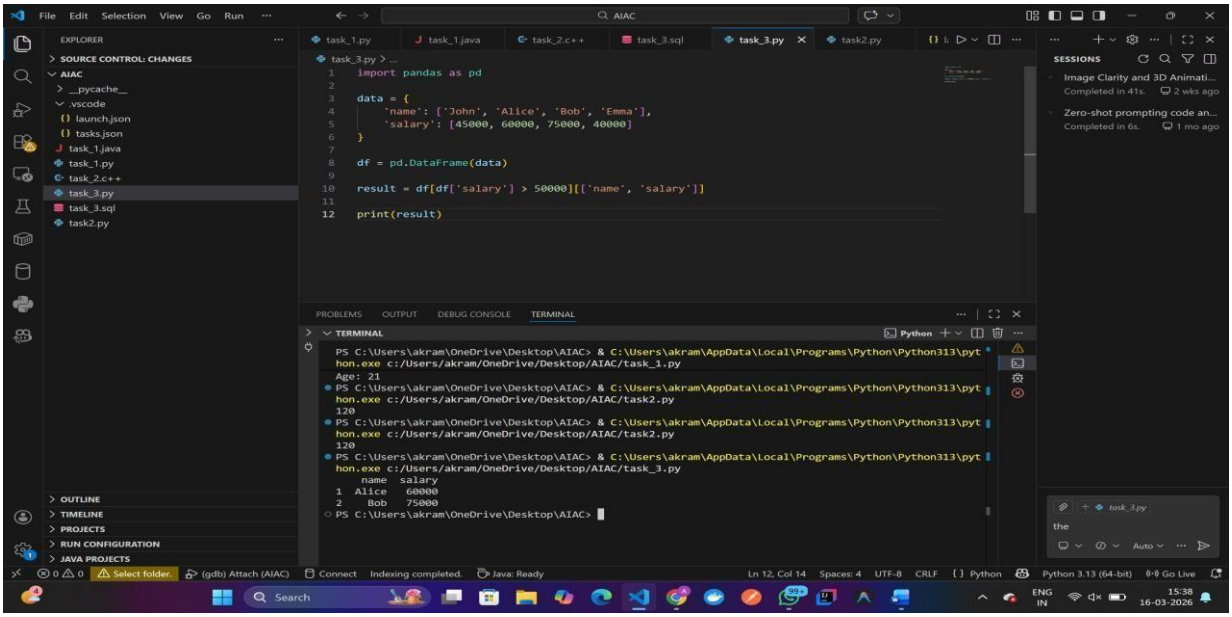
- Test the generated code on a sample DataFrame.

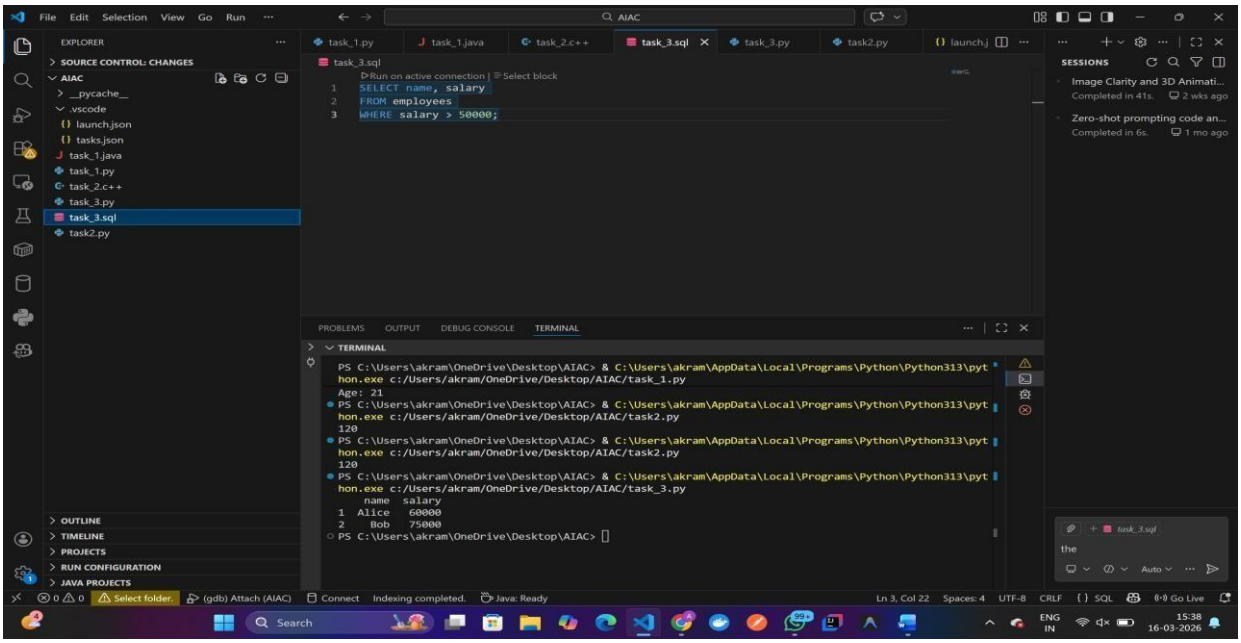
Expected Output:

• Equivalent Pandas query that retrieves the correct subset of

data.

CODE:





**Task 4 – Real-Time Application: Multi-Language Snippet**

Converter

Scenario:

Students will choose a real-time use case where they need code in multiple languages.

Example:

- Converting a Python web scraping snippet into JavaScript for browser automation.
- Translating a Java method into C# for enterprise applications.

Instructions:

- Prompt AI to translate code between two chosen languages.
- Test both implementations to ensure they produce the same results.
- Document challenges faced during translation (e.g., syntax, libraries).

Expected Output:

- Working equivalent code snippets in at least two different programming languages CODE:
