

# **AI ASSISTED CODING**

## **LAB-12.5**

**Katta Lasya**

**2303A51724**

**Batch-11**

### **Task Description #1 (Sorting – Merge Sort Implementation)**

- Task: Use AI to generate a Python program that implements the Merge Sort algorithm.
- Instructions:

- o Prompt AI to create a function `merge_sort(arr)` that sorts a list in ascending order.
- o Ask AI to include time complexity and space complexity in the function docstring. o

Verify the generated code with test cases.

- Expected Output:
- o A functional Python script implementing Merge Sort with proper documentation.

### **PROMPT:**

#Generate code for `merge_sort(arr)` function to sort an array in ascending order, include time and space complexity in docstring.

### **GIVEN CODE AND OUTPUT:**

```
1 #Generate code for merge_sort(arr) function to sort an array in ascending order, include time and space complexity in docstring.
2 def merge(left, right):
3     """Helper function to merge two sorted arrays."""
4     result = []
5     i = j = 0
6     while i < len(left) and j < len(right):
7         if left[i] <= right[j]:
8             result.append(left[i])
9             i += 1
10        else:
11            result.append(right[j])
12            j += 1
13    result.extend(left[i:])
14    result.extend(right[j:])
15    return result
16
17 def merge_sort(arr):
18     """Sort an array in ascending order using the merge sort algorithm.
19
20     Merge sort is a divide-and-conquer algorithm that recursively divides the array into halves, sorts each half, and then merges the sorted halves back together.
21     The time complexity of merge sort is  $O(n \log n)$  in all cases (best, average, and worst), making it an efficient sorting algorithm for large datasets.
22     The space complexity is  $O(n)$  due to the temporary arrays used during the merging process.
23
24     Args:
25         arr (list): The list of elements to be sorted."""
26     if len(arr) <= 1:
27         return arr
28
29     mid = len(arr) // 2
30     left_half = merge_sort(arr[:mid])
31     right_half = merge_sort(arr[mid:])
32
33     return merge(left_half, right_half)
34
35 #Example usage:
36 arr = list(map(int, input("Enter the array elements separated by space: ").split()))
37 sorted_arr = merge_sort(arr)
38 print("Sorted array:", sorted_arr)
```

## Task Description #2 (Searching – Binary Search with AI

### Optimization)

- Task: Use AI to create a binary search function that finds a target element in a sorted list.
- Instructions:
  - o Prompt AI to create a function `binary_search(arr, target)` returning the index of the target or -1 if not found.
  - o Include docstrings explaining best, average, and worst-case complexities.
  - o

Test with various inputs.

### • Expected Output:

- o Python code implementing binary search with AI-generated comments and docstrings.

### PROMPT:

#Generate code for `binary_search(arr, target)` function to return the index of the target element and -1 if not found, include best, average, and worst-case complexities in docstring.

### GIVEN CODE AND OUTPUT:

```
1 #Generate code for binary_search(arr, target) function to return the index of the target element and -1 if not found, 1
2 def binary_search(arr, target):
3     """Perform binary search on a sorted array to find the index of the target element.
4
5     Args:
6         arr (list): A sorted list of elements.
7         target: The element to search for in the array.
8
9     Returns:
10         int: The index of the target element if found, otherwise -1.
11     Complexity:
12         Best Case: O(1) - when the target is at the middle of the array.
13         Average Case: O(log n) - when the target is found after several iterations.
14         Worst Case: O(log n) - when the target is not found or is at the end of the array.
15     """
16     left, right = 0, len(arr) - 1
17
18     while left <= right:
19         mid = left + (right - left) // 2
20
21         # Check if the target is present at mid
22         if arr[mid] == target:
23             return mid
24         # If target is greater, ignore the left half
25         elif arr[mid] < target:
26             left = mid + 1
27         # If target is smaller, ignore the right half
28         else:
29             right = mid - 1
30
31     # Target was not found in the array
32     return -1
33
34 # Example usage:
35 sorted_array = [1, 2, 3, 4, 5, 6, 7, 8, 9]
36 target = 5
37 result = binary_search(sorted_array, target)

### **Task Description #7: Smart Agriculture Crop Monitoring System**

An agriculture monitoring system stores crop data with crop ID, crop name, soil moisture level, temperature, and yield estimate. Farmers need to:

1. Search crop details using crop ID.
2. Sort crops based on moisture level or yield estimate.

### **Student Task**

- Use AI-assisted reasoning to select algorithms.
- Justify algorithm suitability.
- Implement searching and sorting in Python.

### **PROMPT:**

#write a python program to create an agriculture monitoring system it stores crop data with crop id,crop name,soil moisture level,temperature,and yeild estimate. you have to search crop details using crop id and sort crops based on moisture level or yield estimate .you have to select reasoning algorithm and jusity alorithm and implement searching and sorting

### **CODE AND OUTPUT:**

```
